

## GCREW Workflow from Data Entry to Public Posting

(1) Copy from “toolkit” folder the “Data Entry Templates” folder specific folder to an experiment, data set and year. Next copy the two SAS QAQC programs from the “Data” folder in the most recently analyzed data year. Place in folder for the new year being analyzed.

(2) Enter data into Excel template. Once harvest data is entered copy data from the three communities to “Compiled” worksheet. Save “Data” worksheet (or “Compiled” harvest data) to plain format CSV for input to SAS. Metadata and any other worksheets will be lost.

(3) Edit SAS QAQC programs for new input/output file paths and names. SAS adds new variables needed to match the “active” file and create separate output files if needed. SAS program has details.

(4) Run QAQC SAS program

pass

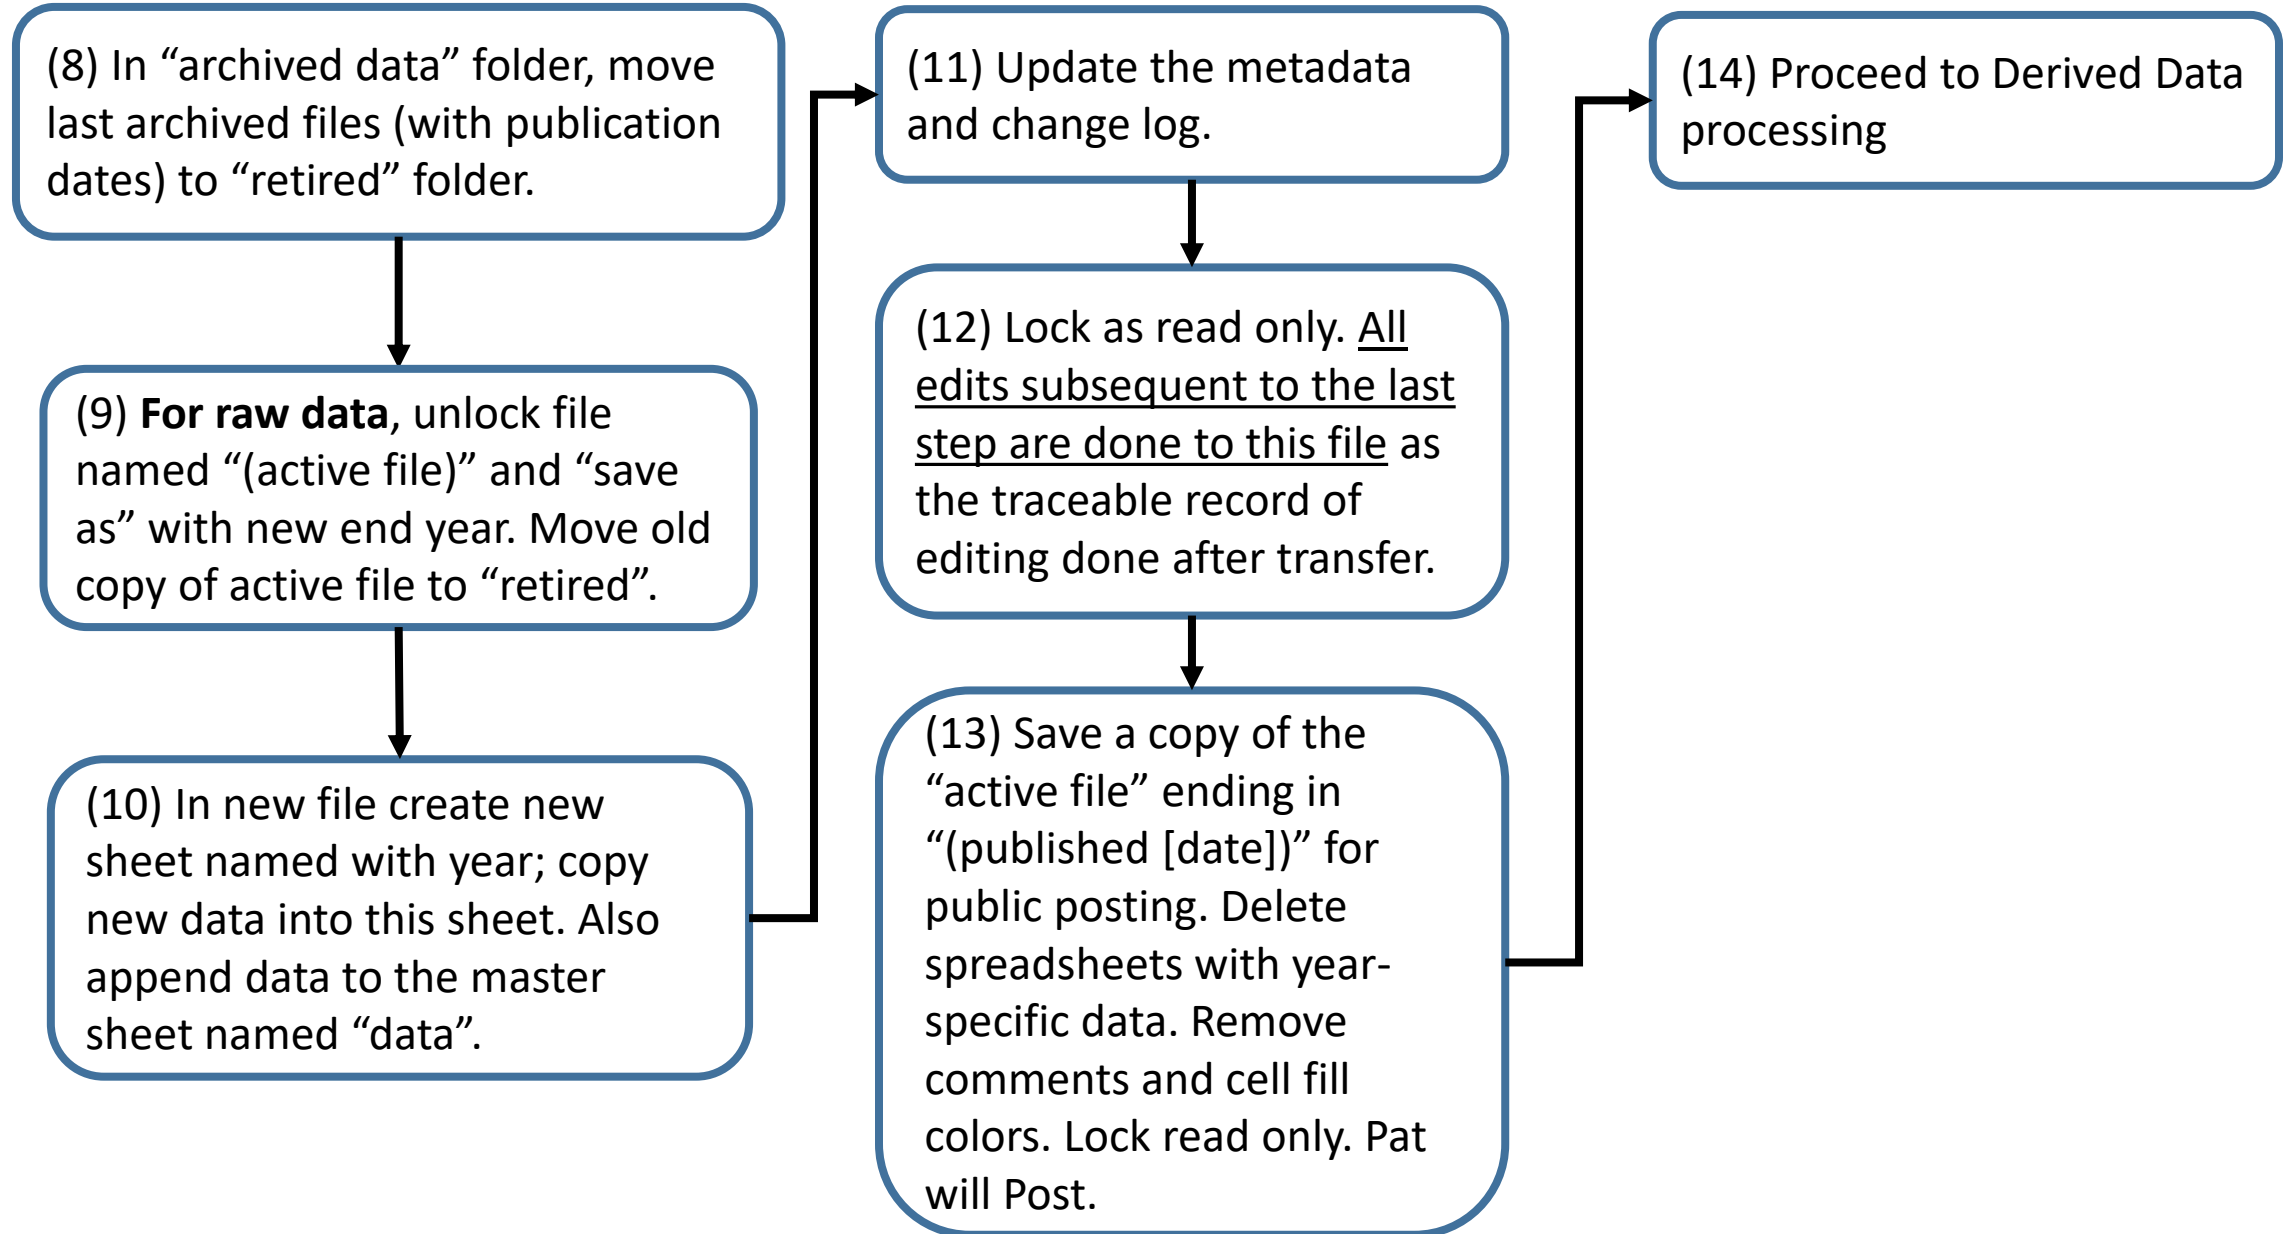

fail

(5) Edit data in original Excel file, add comments to data cell in the Excel file on changes made, save as CVS, and rerun SAS. If flagged observations are unresolved add note to error CVS file.

(6) Lock all files in this step (e.g. files beginning with “1-”) as read only. These files remain in the folder associated with a given experiment, year, and data type, but data will be copied to “active” files in the next step.

(7) Open a new window and proceed to “0-GCReW Archive” then “Archived Data”
